1 Introduction

In the first part of this assignment, I update theta and pi according to my mouse movement in the file given to me. At the same time, I do the mouse movement with the pointer lock api and I make it active and deactivate with 'p'.

In the second part of this assignment, I save the vertices to arrays with the given obj file. And I try to rotate the resulting monkey-head shape counterclockwise continuously. And I handle the increase and decrease of this rotation speed with the '+' and '-' keys and I change the position of the camera by pressing many keys. Also, I used mouse movement for this part.

2 Experiment

2.1 Part 1

In this part, if the x position of the mouse has changed, I have updated the theta. If the y position has changed, I have updated the phi.

At the same time, I have made the mouse movement with the pointer lock api and I used `exitPointerLock()` and `requestPointerLock()` to make it active and deactivate with 'p'.

2.2 Part 2

In this part, I first used ajax (jquery) for load mesh and I saved the vertices to the `verticesOfShape` array with the given obj file.

I try to rotate the resulting monkey-head shape counterclockwise continuously. I used theta and rotate for this. And I handle the increase and decrease of this rotation speed with the '+' and '-' keys.

I used `lookAt` to change the camera position. I also used `perspective` to calculate the projection matrix. With these actions, I changed the x, y or z positions of the camera according to the key I pressed.

Finally, I do the mouse movement with the pointer lock api. I changed camera position according to mouse movement. I used `exitPointerLock()` and `requestPointerLock()` to make it active and deactive with 'p'. Also I used `document.onkeydown` for keyboard events.

Table 1: Classes

Class Name	Attributes	Methods
initialize	-	<code>_createBufferObject</code> , <code>loadShader</code> <code>initShaderProgram</code>
app	<code>gl</code> , <code>type</code> , <code>normalize</code> , <code>stride</code> , <code>offset</code> , <code>program</code> <code>canvas</code> , <code>colorF</code> , <code>modelViewMatrix</code> , <code>aspectRatio</code> <code>cameraPos</code> , <code>target</code> , <code>moveCallback</code> , <code>x</code> , <code>y</code> , <code>isM</code> <code>verticesOfShape</code> , <code>vertexCount</code> , <code>posBuffer</code> , <code>theta</code> , <code>speed</code>	<code>pointerLockApi</code> , <code>render</code> , <code>loadMeshData</code> <code>objLoader</code> , <code>init</code> , <code>onkeydown</code>
shaders	<code>vsSource</code> , <code>fsSource</code>	-
MV	-	-

Table 2: Methods

Method Name	Input(s)	Output(s)	Info
<code>_createBufferObject</code>	<code>gl</code> , <code>array</code>	<code>buffer</code>	Create buffer object
<code>loadShader</code>	<code>gl</code> , <code>type</code> , <code>source</code>	<code>shader</code>	Create and compile shader
<code>initShaderProgram</code>	<code>gl</code> , <code>vsSource</code> , <code>fsSource</code>	<code>shaderProgram</code>	Initialize shader program
<code>render</code>	-	-	Create to use uniform locations, <code>perspective</code> , <code>lookAt</code> and <code>theta</code>
<code>pointerLockApi</code>	-	-	To mouse movement
<code>init</code>	-	-	Create to use program, buffer object and initialize some variable
<code>loadMeshData</code>	<code>string</code>	-	Push vertices into the array
<code>onkeydown</code>	<code>e</code>	-	Create to use keyboard keys
<code>objLoader</code>	-	-	Send javascript object with AJAX

3 Conclusion

In this section, I learned obj load and I did it by understanding jquery (ajax). I also understood the use of lookAt,perspective. and I used the pointer lock api to perform the mouse movement correctly. According to me, the most challenge part was to doing controllable camera.
